

# INFLUENZA WEEKLY UPDATE

2004/32: 02 August – 08 August 2004

In the past week, a total of 97 consultations for influenza-like illness were reported from 83 general practices in 22 out of 24 health districts. This gives a weekly consultation rate of 27.1 per 100 000 patient population.

Figure 1 compares the consultation rates for influenza-like illness for each health district over the past week. Hutt had the highest consultation rate (142.9 per 100 000), followed by Otago (97.2 per 100 000).

Twenty-nine swabs were sent from the sentinel surveillance in the past week. Twenty-seven swabs were received by virology laboratories. The virus from these swabs is yet to be identified.

Two influenza A isolates (yet to be subtyped) from Central Auckland and Canterbury were reported for the laboratory-based (non-sentinel) surveillance.

Figure 2 shows the cumulative total of influenza isolates confirmed (sentinel and laboratory-based surveillance) to the end of week 32, July 2004. A total of 22 isolates were identified. Of these, 14 were influenza A (yet to be subtyped), five were subtyped as A/Fujian/411/2002 (H3N2), and three as influenza B.

Figure 2

[ ] The two A/Fujian/411/2002 (H3N2) viruses reported from South Auckland were specimens taken in March.

Figure 3 shows the weekly national consultation rates for 2002 and 2003 seasons, and 2004 so far. The current rate of influenza is lower than at the same time last year.

Figure 3

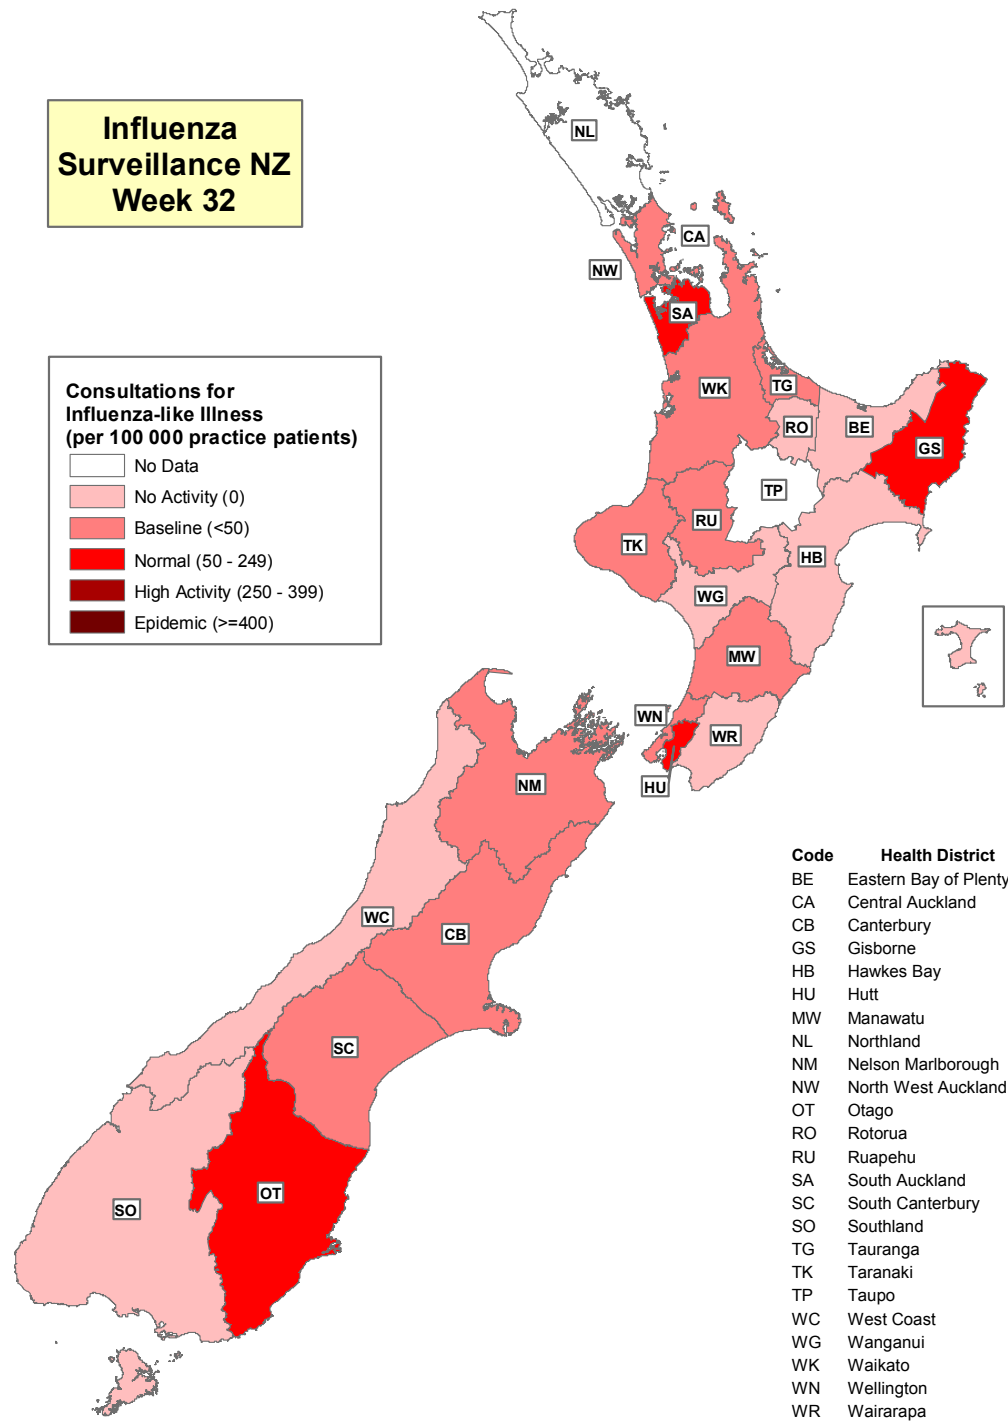

Figure 4 illustrates consultation rates for influenza-like illness mapped by health district for week 32, 2004.

Figure 4

The threshold used to describe the influenza-like activity can be referred in New Zealand Public Health Report 2001, 8 (1): 9-12 "Influenza surveillance and immunisation in New Zealand, 1990-1999"
