In the past week, a total of 309 consultations for influenza-like illness were reported from 78 general practices in 21 of the 24 health districts. This gives a weekly consultation rate of 92.3 per 100,000 patient population.

Figure 1 compares the consultation rates for influenza-like illness for each health district over the past week. Northland had the highest consultation rate (583.1 per 100,000), followed by Wanganui (539.5 per 100,000).

Figure 1

![Weekly consultation rates for influenza-like illness by health district week ending 25 July 2008](image)

[ ] Health districts did not participate for the week.

Note: Some health districts have only one sentinel GP with a small patient denominator so the consultation rates could be high (e.g. Northland).

Fifty-seven swabs were sent from the sentinel surveillance in the past week. Sixty-one swabs were received by virology laboratories. Of these, 28 influenza viruses were identified, 10 A H3N2 (not antigenically sub-typed), eight influenza A (yet to be sub-typed), eight B (not antigenically typed), and two B/Florida/4/2006 – like. The distribution by health district is shown in Table 1.

In addition, 37 influenza viruses were reported this week from the laboratory-based (non-sentinel) surveillance, 24 B (not antigenically typed), and 13 influenza A (yet to be sub-typed). The distribution by health district is shown in Table 2.

Figure 2 shows the cumulative total of influenza viruses confirmed (sentinel and laboratory-based surveillance) to the end of week 30, 25 July 2008. A total of 377 influenza viruses were identified, 163 influenza A (yet to be sub-typed), 54 A/Brisbane/10/2007 (H3N2) – like, 41 A H3N2 (not antigenically sub-typed), one A H1N1 (not antigenically sub-typed), 98 influenza B (not antigenically typed), and 20 B/Florida/4/2006 – lineage.

Figure 3 shows the weekly national consultation rates for 2006 and 2007 seasons, and 2008 so far. The current rate of influenza is higher than at the same time last year.
