The national influenza surveillance system in New Zealand is an essential public health component for assessing and implementing strategies to control influenza. This report summarises the data collected from sentinel general practice (GP) surveillance and non-sentinel surveillance for week 47 (16-22 November 2009). While the primary purpose of the sentinel surveillance system has been to contribute to the deliberations on the composition of the following year’s seasonal influenza vaccine, it has provided timely information on the progress of the current pandemic. Although the first wave of the pandemic influenza in New Zealand is now almost over but a second wave is expected. Sentinel influenza surveillance will be vital for monitoring the development of this pandemic and thus the sentinel influenza surveillance will be extended till next winter.

IN THIS REPORT:

- There has been a slight increase in consultations for influenza-like illness through sentinel surveillance in week 47 (16-22 November 2009). The highest weekly ILI rates were reported from South Auckland, Rotorua and Otago health districts. The highest ILI consultation rates have been reported among children and teenagers aged 0 to 19 years.

- Up to 22 November 2009, a total of 4885 influenza viruses have been reported through sentinel (624, 13%) and non-sentinel surveillance (4261, 87%). One influenza virus was reported in week 47 as pandemic (H1N1) 09 from the sentinel surveillance. Pandemic (H1N1) 09 has become the predominant strain among all influenza viruses. Seasonal A (H1N1) strain has been the predominant strain among all seasonal influenza viruses.

- Since January 2008, a global emergence and rapid spread of oseltamivir-resistant seasonal influenza A (H1N1) viruses has been observed. Since 2009 in New Zealand, a total of 53 seasonal A (H1N1) viruses have been tested by either a phenotypic assay or a molecular assay and all 53 viruses have been resistant to oseltamivir.

- Most Pandemic influenza (H1N1) 09 viruses reported globally are sensitive to oseltamivir. Forty two viruses have now been described from around the world which are resistant to oseltamivir, all carrying the same mutation (H275Y) that confers resistance to the antiviral oseltamivir but not to the antiviral zanamivir. Over 10 000 viruses have been tested worldwide and have all been shown to be sensitive to oseltamivir. During this winter season in New Zealand, a total of 521 Pandemic influenza (H1N1) 09 viruses were tested by phenotypic assay. All 521 viruses were sensitive to oseltamivir.
SENTINEL GENERAL PRACTICE SURVEILLANCE

In the past week, a total of 110\(^1\) consultations for influenza-like illness were reported from 82 general practices in 20 of the 24 health districts. This gives a weekly consultation rate of 27.9 per 100 000 patient population.

The graph below compares the consultation rates for influenza-like illness for each health district over the past week. South Auckland had the highest consultation rate (99.1 per 100 000, 76 cases), followed by Rotorua (60.2 per 100 000, 1 case) and Otago (29.9 per 100 000, 13 cases).

**Figure 1: Weekly consultation rates for influenza-like illness by health district week ending 22 November 2009**

The weekly national consultation rates are shown in Figure 2 for 2007 and 2008 seasons, and 2009 so far. As seen in the previous years, the rates of influenza-like illness have decreased gradually between week 34 and week 40. However, ILI consultations from the GP sentinel surveillance program are still being reported after week 40 in response to the influenza pandemic this year.

---

\(^1\) Includes ILI consultations through telephone assessment by sentinel GPs starting from week 29 (13-19 July).

SC | South Canterbury
SO | Southland
TG | Tauranga
TK | Taranaki
TP | Taupo
WC | West Coast
WG | Wanganui
WK | Waikato
WN | Wellington
WR | Wairarapa
A total of 26 swabs were received by the virology laboratories. One influenza virus was identified as pandemic H1N1 09 from Central Auckland.

The cumulative figures are shown in Figure 4 for sentinel surveillance by health district from week 18 (27 April-3 May) to week 47 (16-22 November 2009). A total of 624 influenza viruses were identified. The predominant strain was pandemic (H1N1) 2009 (399) including 167 of pandemic influenza A/California/7/2009 (H1N1)v - like strains, followed by seasonal influenza A (H1N1) (98) including 28 of A/Brisbane/59/2007 (H1N1) - like strains, influenza A not subtyped (61), seasonal influenza A (51), seasonal influenza A (H3N2) (12), and influenza B not typed (3). Pandemic influenza (H1N1) 09 has become the predominant strain among all influenza viruses from sentinel surveillance.

Figure 4: Cumulative influenza viruses from sentinel surveillance by health district to 22 November 2009
The temporal distribution of influenza viruses is shown in the graph below for sentinel surveillance from week 18 (27 April-3 May) to week 47 (16-22 November 2009). Pandemic influenza (H1N1) 09 is greater than the number of seasonal influenza viruses.

**Figure 5: Total influenza viruses from sentinel surveillance by type and week reported to 22 November and the total percentage positive from the swabs received**

Note: All results of sentinel swabs are received by ESR. The line shows the proportion of those swabs that test positive for any type of influenza. A low proportion may be due to the swabs not successfully retrieving the virus, or that ILI presentations to sentinel GPs are due to other viruses.

The age distribution for influenza-like illness (ILI) consultation rates for weeks 18-47 is shown in Figure 6. The highest ILI consultation rate was in 1-4 years (309.9 per 100 000) followed by those <1 year (259.3 per 100 000) and 5-19 years (161.1 per 100 000).
Figure 6: Sentinel consultation rate for influenza-like illness by age group for weeks 18-47, 2009

NON-SENTINEL SURVEILLANCE

No influenza viruses were reported this week from the laboratory-based (non-sentinel) surveillance.

The cumulative influenza viruses are shown in Figure 7 for non-sentinel surveillance by health district from week 1 (1-4 Jan) to week 47 (16-22 November 2009). A total of 4261 influenza viruses were identified. The predominant strain was pandemic (H1N1) 2009 (2390) including 228 of pandemic influenza A/California/7/2009 (H1N1)v - like strains, followed by seasonal influenza A (H1N1) (618) including 121 of A/Brisbane/59/2007 (H1N1) - like strains, influenza A not subtyped (1054), seasonal influenza A (127), seasonal influenza A (H3N2) (69) including three A/Brisbane/10/2007 (H3N2) - like, and influenza B not typed (3). Pandemic influenza (H1N1) 09 has become the predominant strain among all influenza viruses from non-sentinel surveillance.
Figure 7: Cumulative influenza viruses from non-sentinel surveillance by health district to 22 November 2009

Note: Viruses from Auckland without health district codes have been temporarily assigned to Central Auckland (CA).

The temporal distribution is shown in Figure 8 for influenza viruses reported by type and subtype for each week from non-sentinel surveillance from week 7 (9-15 February) to week 47 (16-22 November 2009). The number of Pandemic influenza (H1N1) 09 is greater than the number of seasonal influenza viruses.

Figure 8: Total influenza viruses from non-sentinel surveillance by type and week reported to 22 November 2009
Since January 2008, a global emergence and rapid spread of oseltamivir-resistant seasonal influenza A (H1N1) viruses has been observed. During this winter season in New Zealand, a total of 28 seasonal A (H1N1) viruses have been tested for the H275Y mutation (histidine-to-tyrosine mutation at the codon of 275 in N1 numbering) which is known to confer resistance to oseltamivir. All 28 viruses had the H275Y mutation. In addition, a total of 25 seasonal A (H1N1) viruses were tested using a phenotypic assay called fluorometric neuraminidase inhibition assay. The results of the fluorometric neuraminidase inhibition assay indicated that these viruses had highly reduced sensitivity to oseltamivir with IC50 values in the range of 305-7912 nM, typical of the recently global emerging oseltamivir-resistant A (H1N1) viruses. (Table 1).

Twelve Pandemic influenza (H1N1) 09 viruses were sequenced to see whether they possess the H275Y mutation. All 12 viruses, including one from a 21 year-old male fatality, did not possess the H275Y mutation. This indicates that these Pandemic influenza A (H1N1) viruses are sensitive to oseltamivir. In addition, a total of 521 Pandemic influenza (H1N1) 09 viruses were tested using the phenotypic assay and all 521 viruses were sensitive to oseltamivir with IC50 values in the range of 0.2 to 1.4 nM (Table 1).
