INFLUENZA WEEKLY UPDATE

2010/32: 9-15 August 2010

The national influenza surveillance system in New Zealand is an essential public health component for assessing and implementing strategies to control influenza. This report summarises the data collected from sentinel general practice (GP) surveillance and non-sentinel surveillance (laboratory-based) for week 32 (9-15 August 2010).

SUMMARY OF THIS REPORT:

- Influenza-like illness (ILI) through sentinel surveillance was reported from 19 out of 20 District Health Boards (DHB) with a national consultation rate of 143.8 per 100 000 (507 ILI consultations).

- A total of 1316 swabs were received from sentinel (131) and non-sentinel surveillance (1185). Of these, 418 influenza viruses have been reported through sentinel (56, 13%) and non-sentinel surveillance (362, 87%). The majority of the viruses were pandemic (H1N1) 09 (337, 81%).

- Since January 2010, 999 cases of pandemic (H1N1) 09 have been recorded in EpiSurv, 375 of which were reported in week 32.

In the past week, a total of 507 consultations for influenza-like illness were reported from 83 general practices in 19 out of 20 DHBs. This gives a weekly consultation rate of 143.8 per 100 000 patient population. Figure 1 shows the weekly national consultation rates for 2008, 2009 seasons, and 2010 to date. The current rate of influenza-like illness is above the baseline.

Figure 2 compares the consultation rates for influenza-like illness for each DHB over the past week. Hawke’s Bay DHB had the highest consultation rate (481.9 per 100 000, 95 cases), followed by Bay of Plenty (294.6 per 100 000, 17 cases) and Waikato (269.0 per 100 000, 53 cases) DHBs.

---

1 Otago and Southland DHBs now combined as Southern DHB.
2 Includes confirmed (949), probable (18), and under investigation (32) cases.
3 Data source: EpiSurv as of 19 August 2010.
**Figure 1: Weekly consultation rates for influenza-like illness in New Zealand, 2008, 2009 and 2010**

*A weekly rate <50 ILI consultations per 100,000 patient population is considered baseline activity. A rate of 50–249 is considered indicative of normal seasonal influenza activity, and a rate of 250–399 indicative of higher than expected influenza activity. A rate >400 ILI consultations per 100,000 patient population indicates an epidemic level of influenza activity.*

**Figure 2: Weekly consultation rates for influenza-like illness by DHB week ending 15 August 2010**

[ ] No GP/practice participating in the sentinel surveillance.
Figure 3 illustrates consultation rates for influenza-like illness mapped by DHB for week 32, 2010.

Consultations for Influenza-like Illness (per 100 000 practice patients)
- No Data
- No Activity (0)
- Baseline (<50)
- Normal (50 - 249)
- High Activity (250 - 399)
- Epidemic (>=400)

Influenza Surveillance NZ
Week 32

Code | District Health Board
--- | ---
AK | Auckland
BP | Bay of Plenty
CB | Canterbury
CC | Capital and Coast
CM | Counties Manukau
HB | Hawke’s Bay
HU | Hutt Valley
LS | Lakes
MC | MidCentral
NL | Northland
NM | Nelson Marlborough
SC | South Canterbury
SN | Southern
TK | Taranaki
TW | Tairawhiti
WC | West Coast
WG | Whanganui
WK | Waikato
WM | Waitemata
WR | Wairarapa
A total of 131 swabs were received by virology laboratories from sentinel surveillance. Of these, 56 influenza viruses were identified: pandemic (H1N1) 09 (40) and A (not sub-typed) (16). The distribution by DHB is shown in Table 1.

In addition, 1185 swabs were received by virology laboratories from non-sentinel surveillance. Of these, 362 influenza viruses were identified: pandemic (H1N1) 09 (297), A (not sub-typed) (64) and A/Perth/16/2009 (H3N2) (1). The distribution by DHB is shown in Table 2.

*Note: Viruses from Auckland without DHB codes have been temporarily assigned to Auckland (AK).*

A/Perth/16/2009 (H3N2) – like strain is included in the 2010 vaccine formulation for New Zealand.

Figure 5 shows the cumulative total of influenza viruses confirmed (sentinel and non-sentinel surveillance) from week 1 to the end of week 32 (15 August 2010). A total of 1165 influenza viruses were identified: pandemic (H1N1) 09 (934), A (not sub-typed) (223), B (not typed) (6), A/Perth/16/2009 (H3N2) (1) and seasonal A (H3N2) (1).

**Figure 4: Cumulative laboratory-confirmed viruses by DHB from week 1 to week 32, 15 August 2010**

The temporal distribution of influenza viruses is shown in the graphs below for sentinel and non-surveillance from week 18 (3-9 May 2010) to week 32 (9-15 August 2010). Pandemic (H1N1) 09 is greater than the number of seasonal influenza viruses.
Figure 5: Total influenza viruses from sentinel surveillance by type and week reported, week 18-32 and the total percentage positive from the swabs received

Figure 6: Total influenza viruses from non-sentinel surveillance by type and week reported, week 18-32 and the total percentage positive from the swabs received
