

INFLUENZA WEEKLY UPDATE

2011/27: 4 - 10 July 2011

The national influenza surveillance system in New Zealand is an essential public health component for assessing and implementing strategies to control influenza. This report summarises the data collected from sentinel general practice (GP) surveillance and non-sentinel surveillance for week 27 (4 - 10 July 2011).

SUMMARY OF THIS REPORT:

Influenza-like illness (ILI) through sentinel surveillance was reported from all 20 District Health Boards (DHB) with a national consultation rate of 49.4 per 100 000 (195 ILI consultations). One hundred and fifty-eight swabs were received from sentinel (53) and non-sentinel surveillance (105). Thirty-eight viruses were identified from sentinel (11) and non-sentinel surveillance (27): B (29), A (not sub-typed) (6), A(H3N2) (2) and pandemic A(H1N1) 09 (1).

INFLUENZA-LIKE ILLNESS SURVEILLANCE

In the past week, a total of 195 consultations for influenza-like illness were reported from 86 general practices in all 20 DHBs. This gives a weekly consultation rate of 49.4 per 100 000 patient population.

The graph below compares the consultation rates for influenza-like illness for each DHB over the past week. Northland DHB (154.9 per 100 000, 26 cases) had the highest consultation rate, followed by Nelson Marlborough (120.2 per 100 000, 21 cases) and Waitemata (113.7 per 100 000, 12 cases).

Figure 1: Weekly consultation rates for influenza-like illness by DHB week ending 10 July 2011

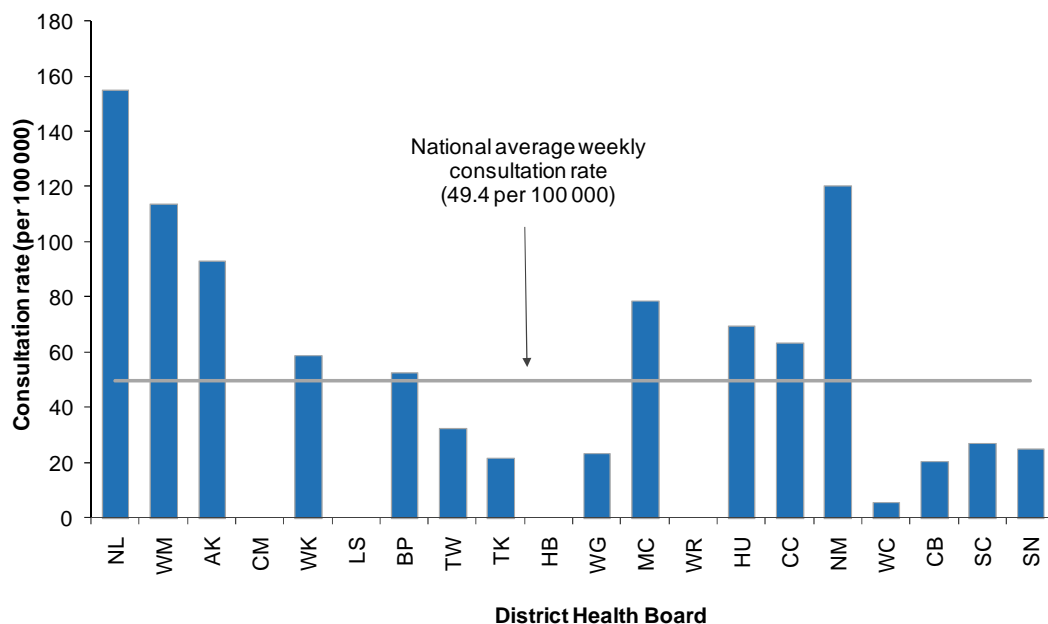

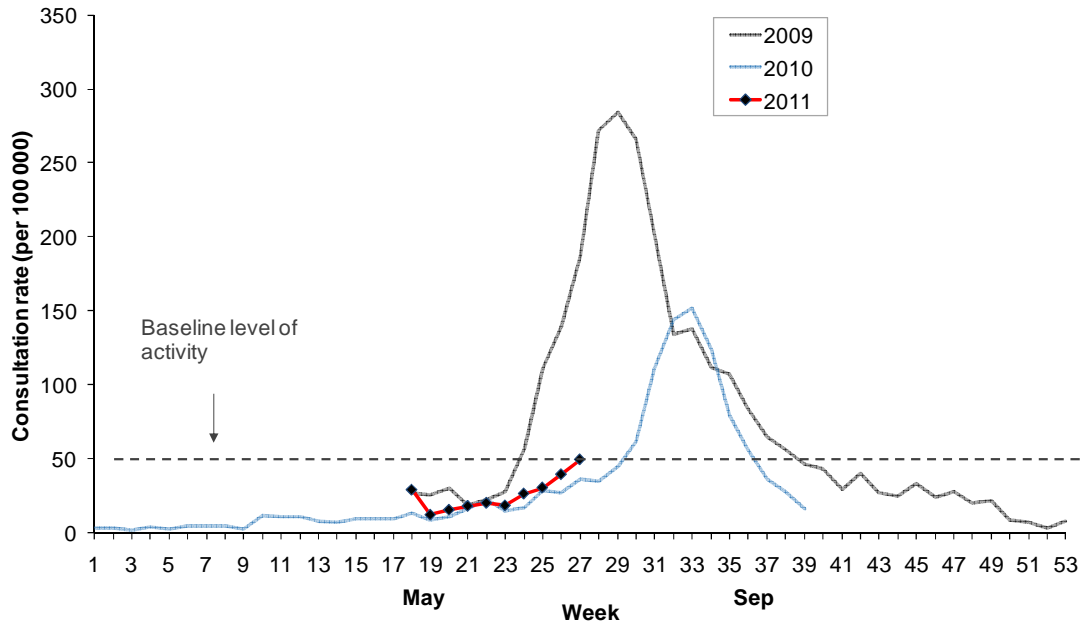

Figure 2 shows the weekly national consultation rates for 2009, 2010 seasons, and 2011 so far. The current rate of influenza-like illness is below the baseline.

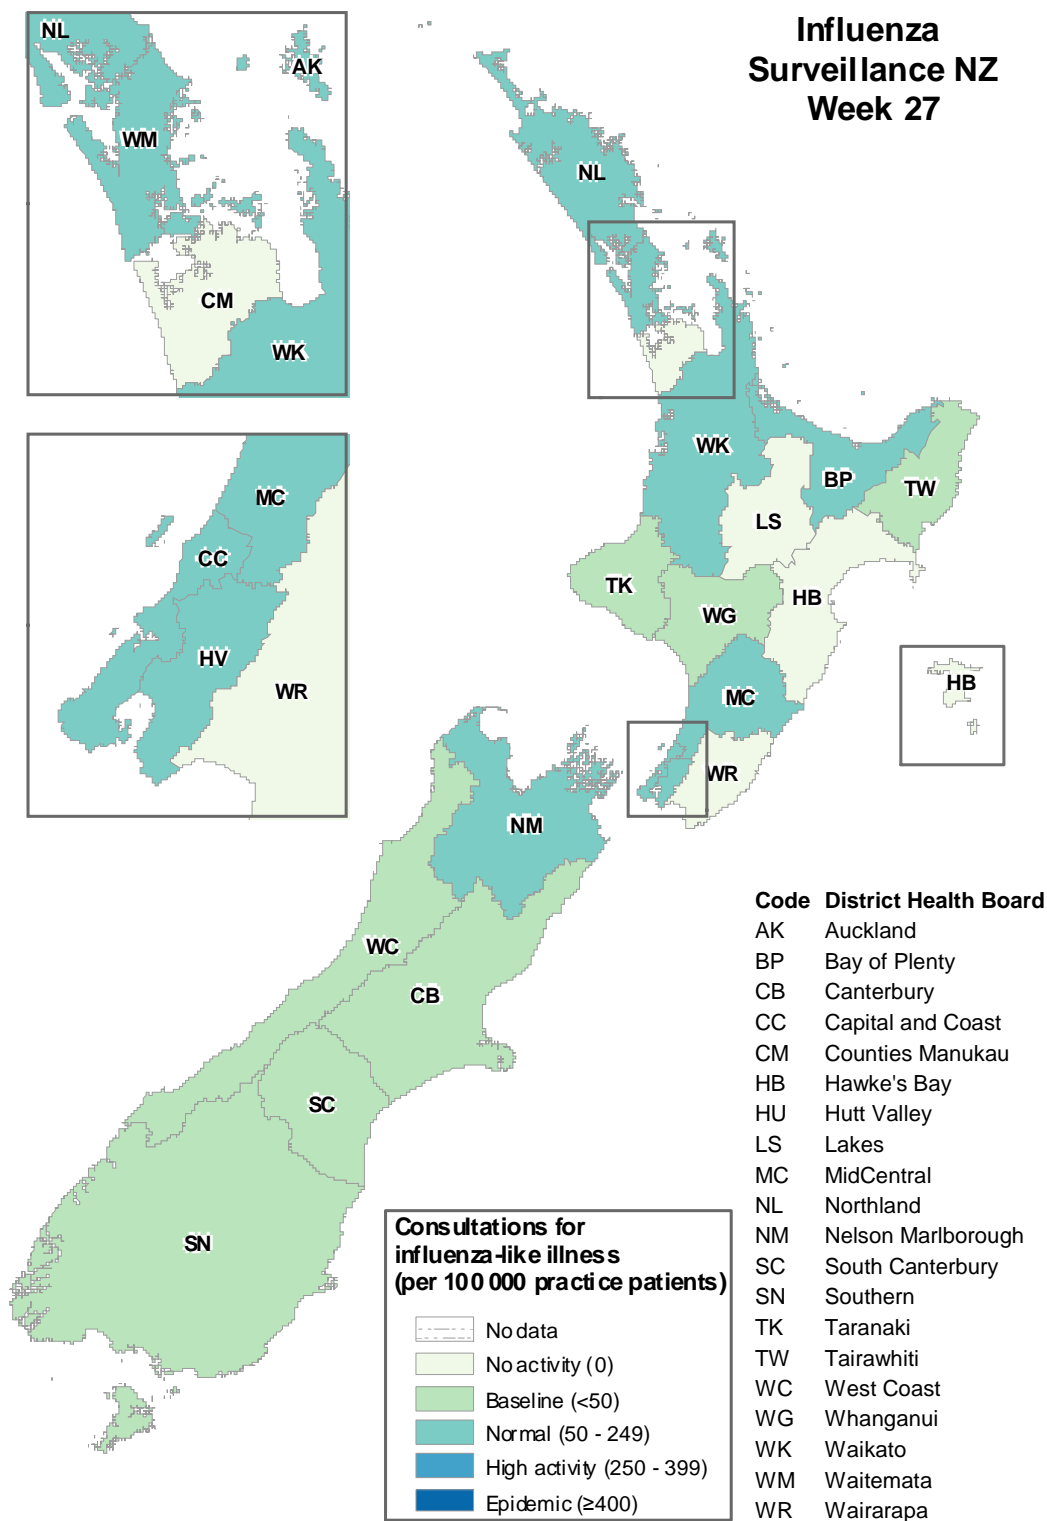

Figure 2: Weekly consultation rates for influenza-like illness in New Zealand, 2009, 2010 and 2011

* A weekly rate <50 ILI consultations per 100 000 patient population is considered baseline activity. A rate of 50–249 is considered indicative of normal seasonal influenza activity, and a rate of 250–399 indicative of higher than expected influenza activity. A rate >400 ILI consultations per 100 000 patient population indicates an epidemic level of influenza activity.

Figure 3 maps the consultation rates for influenza-like illness by DHB.

Figure 3: Consultation rates for influenza-like illness mapped by DHB for week 27, 2011

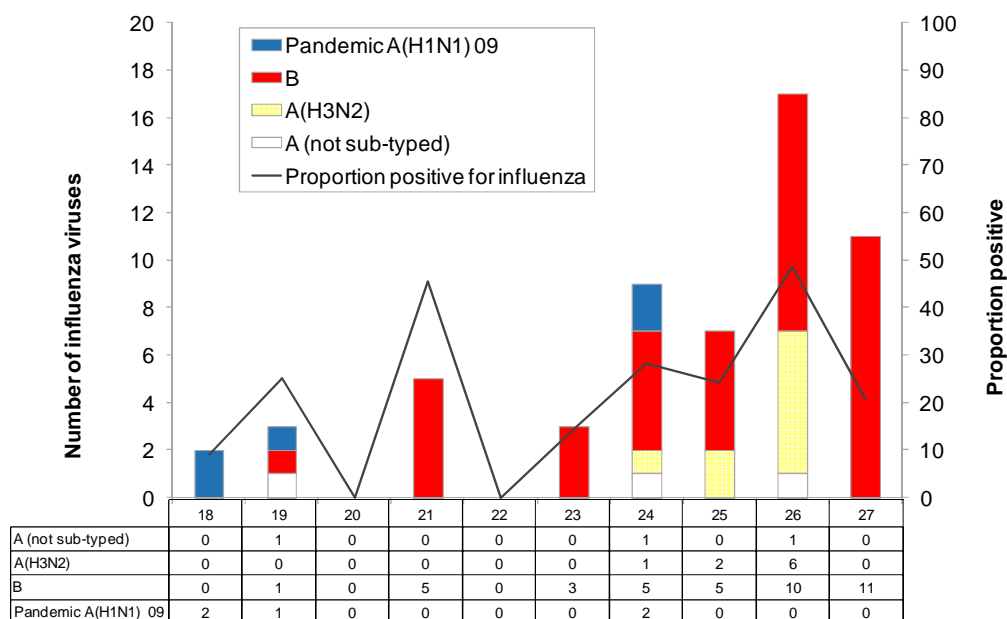

VIROLOGICAL SURVEILLANCE

A total of 53 swabs were received by virology laboratories from sentinel surveillance. Of these, 11 B viruses were identified. The distribution by DHB is shown in Table 1.

Table 1: Influenza viruses from sentinel surveillance for week 27 by DHB

Antigenic Strain	NL	AK	WK	MC	CB	Total
B	3	2	1	3	2	11
Total	3	2	1	3	2	11

Figure 4: Total influenza viruses from sentinel surveillance by type and week reported, weeks 18–27 and the total percentage positive from the swabs received

In addition, 105 swabs were received by virology laboratories from non-sentinel surveillance. Of these, 27 viruses were identified: B (18), A (not sub-typed) (6), A(H3N2) (2) and pandemic A(H1N1) 09 (1) (Figure 5). The distribution by DHB is shown in Table 2.

Table 2: Influenza viruses from non-sentinel surveillance for week 27 by DHB

Antigenic Strain	AK	CM	WK	HB	MC	CC	Total
A (not sub-typed)	1	4	0	0	0	1	6
A(H3N2)	0	1	0	0	1	0	2
B	1	4	10	0	1	2	18
Pandemic A(H1N1) 09	0	0	0	1	0	0	1
Total	2	9	10	1	2	3	27

Figure 5: Total influenza viruses from non-sentinel surveillance by type and week reported, weeks 18–27 and the total percentage positive from the swabs received

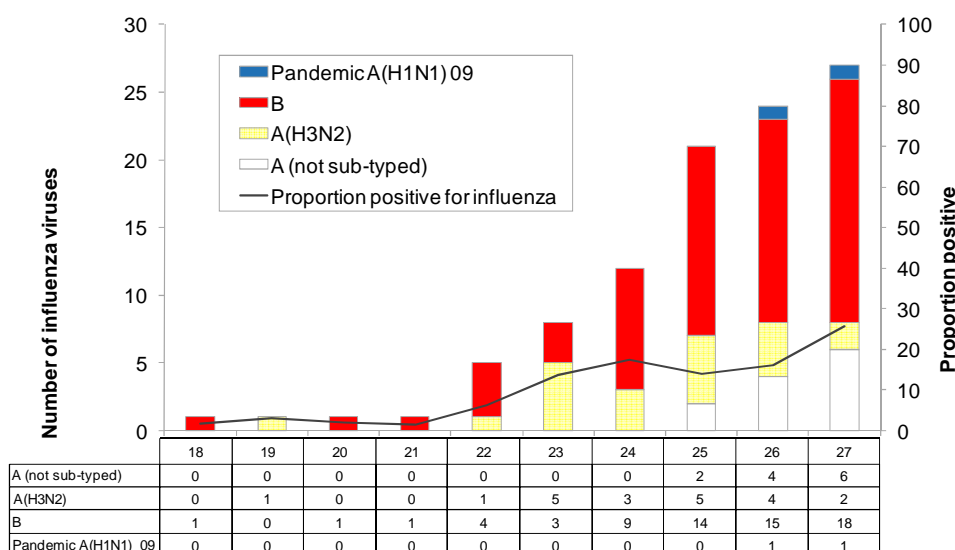

Figure 6 shows the cumulative total of influenza viruses confirmed (sentinel and non-sentinel surveillance) from week 1 to the end of week 27 (10 July 2011). A total of 196 influenza viruses were identified: influenza B (112) including 41 of B/Brisbane/60/2008 - like viruses and one B/Florida/4/2006 - like virus, pandemic (H1N1) 09 (28) including four A/California/7/2009 (H1N1) - like virus, A (H3N2) (37) including 12 A/Perth/16/2009 (H3N2) - like virus, and A (not sub-typed) (19). The major circulating influenza strains (B/Brisbane/60/2008 - like, A(H3N2) and A(H1N1)) are covered by the 2011 influenza vaccine.
