The national influenza surveillance system in New Zealand is an essential public health component for assessing and implementing strategies to control influenza. This report summarises the data collected on influenza-like illness (ILI) from sentinel general practice (GP) surveillance and non-sentinel surveillance for week 38 (17 – 23 September 2012).

Summary

- ILI through sentinel surveillance was reported from 19 out of 20 District Health Boards (DHB) with a national consultation rate of 21.0 per 100 000 (80 ILI consultations).
- A total of 290 swabs were received from sentinel (8) and non-sentinel (282) surveillance.
- 46 viruses were identified: A (Not subtyped) (19), A(H3N2) (13), B (Lineage not determined) (12), and A(H1N1)pdm09 (2) including one A/California/7/2009 (H1N1)-like virus.

In week 38, ILI consultation rate has decreased below the baseline. The proportion of positive influenza samples has also decreased. Influenza A(H3N2) viruses remain the predominant virus in many regions. These viruses do not appear to demonstrate a major antigenic drift.

INFLUENZA-LIKE ILLNESS SURVEILLANCE

In the past week, a total of 80 consultations for ILI were reported from 80 general practices in 19 out of 20 DHBs. This gives a weekly consultation rate 21.0 of per 100 000 patient population, a decrease from 34.2 per 100 000 reported in week 37. Figure 1 shows the weekly national consultation rates for 2007–2012 to date.
A weekly rate <50 ILI consultations per 100 000 patient population is considered baseline activity. A rate of 50–249 is considered indicative of normal seasonal influenza activity, and a rate of 250–399 indicative of higher than expected influenza activity. A rate >400 ILI consultations per 100 000 patient population indicates an epidemic level of influenza activity.

Figure 2 compares the consultation rates for ILI for each DHB over the past week. South Canterbury DHB had the highest consultation rate (77.8 per 100 000, 6 cases) followed by Capital and Coast (42.2 per 100 000, 13 cases) and Auckland (40.4 per 100 000, 8 cases).
Figure 3. Consultation rates for ILI mapped by DHB for week 38, 2012

Influenza Surveillance NZ
Week 38

Consultations for influenza-like illness (per 100,000 practice patients)

- No data
- No activity (0)
- Baseline (<50)
- Normal (50-249)
- High activity (250-399)
- Epidemic (≥400)

VIROLOGICAL SURVEILLANCE

A total of eight\(^1\), swabs were received by virology laboratories from sentinel surveillance. Of these, eight viruses were identified (Figure 4): A (Not subtyped) (5), B (Lineage not determined) (2), and A(H3N2) (1). The distribution by DHB is shown in Table 1.

In addition, 282\(^1\) swabs were received by virology laboratories from non-sentinel surveillance. Of these, 38 viruses were identified (Figure 5): A (Not subtyped) (14), A(H3N2) (12), B (Lineage not determined) (10), and A(H1N1)pdm09 (2) including one A/California/7/2009 (H1N1)-like virus. The distribution by DHB is shown in Table 2.

## Figure 5. Total influenza viruses from non-sentinel surveillance by type and week reported, week 18–38 and the total percentage positive from the swabs received

Figure 6 shows the cumulative total of influenza viruses confirmed (sentinel and non-sentinel surveillance) from week 1 to the end of week 38 (23 September 2012) in each DHB. A total of 2302 influenza viruses were identified: influenza A(H3N2) (1514) including 378 A/Perth/16/2009 (H3N2)-like viruses, B (237) including 14 of B/Brisbane/60/2008-like (belonging to the B/Victoria lineage) and 64 B/Wisconsin/1/2010-like viruses (belonging to the B/Yamagata lineage), A(H1N1)pdm09 (242) including 79 A/California/7/2009 (H1N1)-like virus, and A (Not subtyped) (309). The highest numbers were from the Canterbury DHB, followed by Auckland/Waitemata and Counties Manukau DHBs.

Note: The 2012 southern hemisphere winter influenza vaccine has the following composition: A/California/7/2009(H1N1)-like, A/Perth/16/2009(H3N2)-like and B/Brisbane/60/2008-like strains.
